TRB 90<sup>th</sup> Annual Meeting: Session on Surrogate Measures of Road Safety for Modeling and Management

# Investigating Collision Factors by Mining Microscopic Data of Vehicle Conflicts and Collisions

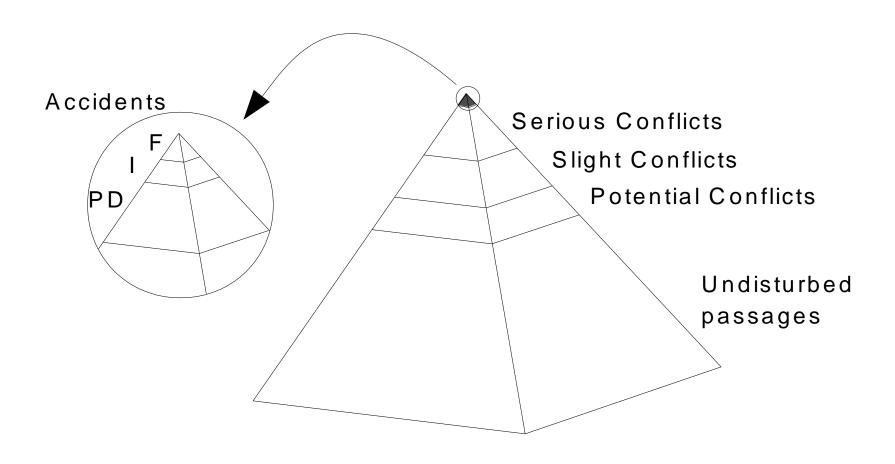

Nicolas Saunier, Nadia Mourji and Bruno Agard École Polytechnique de Montréal

#### Motivation

- Need for surrogate measures of road safety
- Difficult validation of surrogate measures of safety, debates about conflicts, definitions...

### Hypothesis: the Safety Hierarchy

### Objective

- Understand collision processes to
  - design better counter-measures
  - develop better surrogate measures based on better-known relationships between interactions with and without a collision
- How?
  - continuous traffic data collection: record all traffic events, e.g. using video sensors
  - Knowledge Discovery and Data Mining (KDD) techniques

# Trajectories Extraction from Video Data

#### Conflicts

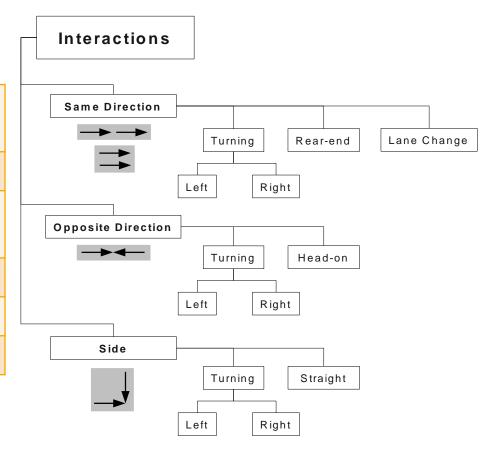

Collisions

(Saunier, Sayed and Ismail 2010)

# Interaction Description: Categorical Attributes

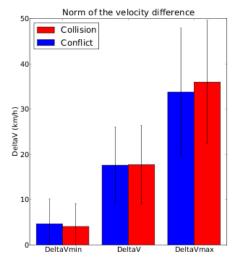

Categorical Attributes	Values
Type of day	weekday, week end
Lighting condition	daytime, twilight, nighttime
Weather condition	normal, rain, snow
Interaction category	see figure
Interaction outcome	conflict, collision

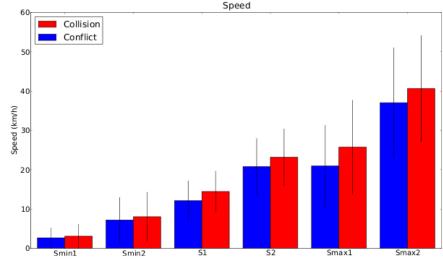

### Interaction Description: Numerical Attributes

Numerical Attributes	Units		
Road user type passenger car van, 4x4, SUV bus	number of	road users per type	
Road user origin	number of road users per origin		
Type of evasive action No evasive action Braking Swerving Acceleration	number of evasive actions per evasive action		
3 attributes from the speed differential $\Delta v$ (min, max and mean)	km/h	Coarse symmetric description of the relative road users' trajectories	
6 values from the road users' speeds (min, max and mean for each)	km/h		

## **Descriptive Analysis**

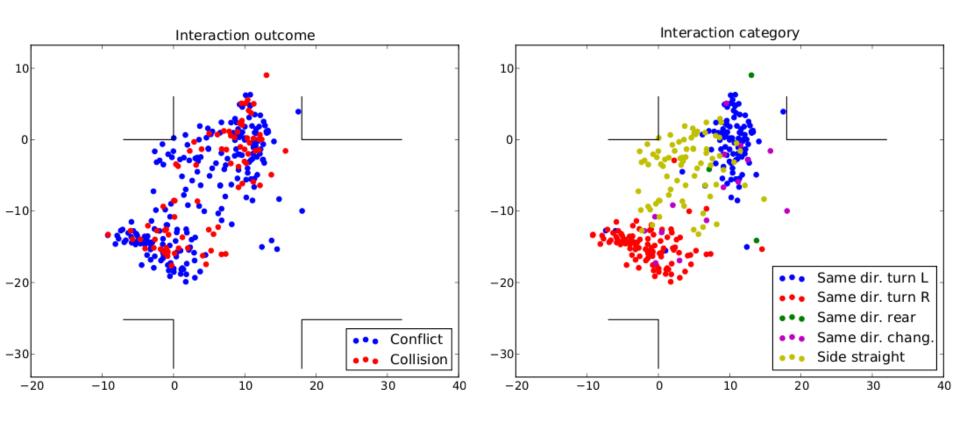

January 26th 2011

Saunier, Mourji and Agard, Ecole Polytechnique de Montreal - TRB Annual Meeting 2011

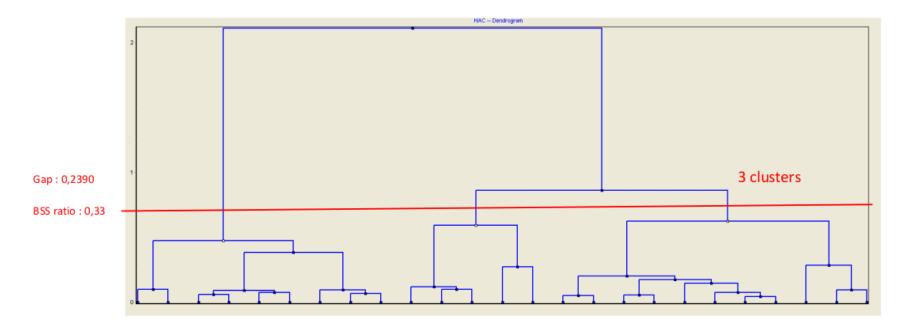

### **Descriptive Analysis**

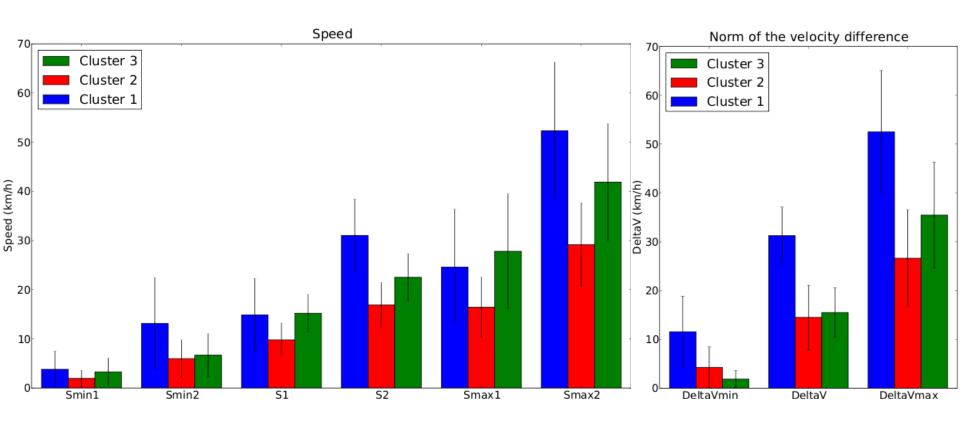

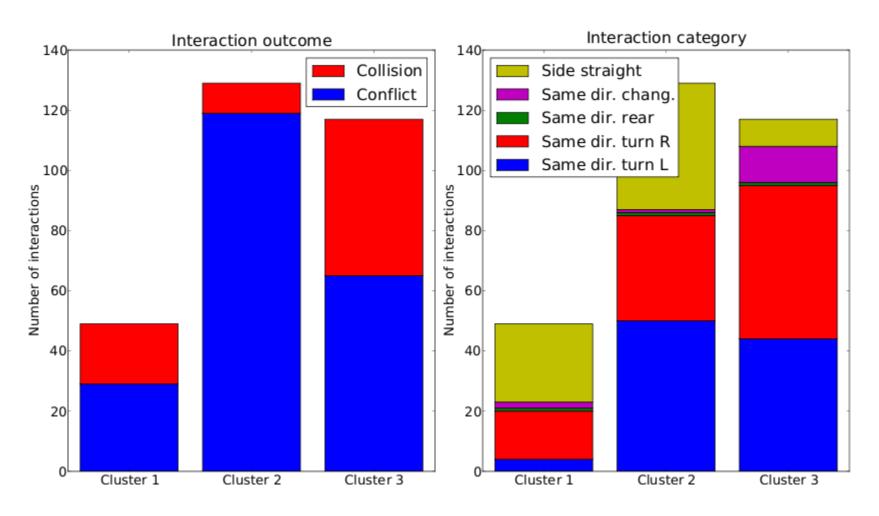

#### **Decision Tree**

- Evasive actions in [braking/no evasive action]
  - ∆v < 12.6183</li>
    - \$\overline{51}\$ < 13.4022 then Interaction outcome = conflict (83.33 % of 12 examples)</li>
    - s1 ≥ 13.4022 then Interaction outcome = collision (83.33 % of 6 examples)
  - Δv ≥ 12.6183 then Interaction outcome = conflict (95.31 % of 64 examples)
- Evasive actions in [no evasive action/no evasive action] then Interaction outcome = collision (91.18 % of 68 examples)

 The k-means and hierarchical agglomerative clustering algorithms yield 3 clusters

- Cluster 1: collisions, highest speeds, categories side straight and same direction turning right
- Cluster 2: almost pure conflicts, lowest speeds
- Cluster 3: collisions, medium speeds, categories same direction turning left and right and same direction changing lanes

#### Conclusion

- Method to understand collision processes
  - find groups of similar conflicts and collisions
  - supplementary evidence that not all conflicts should be used as surrogates for all collisions
- Work in progress:
  - compare the whole time series of interaction description variables
  - collect large datasets of trajectories
- Open science: share data and code (as open source)

### Background

- There is some evidence that evasive actions undertaken by road users involved in conflicts may be of a different nature than the ones attempted in collisions (Davis et al., 2008)
  - Importance for surrogate safety measures: what interactions without a collision may be used as surrogates for collisions?

### Kentucky Dataset

- Video recordings kept for a few seconds before and after the sound-based automatic detection of an interaction of interest
  - 213 traffic conflicts (229)
  - 101 collisions (82)
- The existence of an interaction or its severity is not always obvious
- The interactions recorded in this dataset involve only motorized vehicles
- Limited quality of the video data: resolution, compression, weather and lighting conditions
- Calibration done using the tool developed by Karim Ismail (Ismail, Sayed and Saunier, 2010)
